

NEW

Heather Management System

Wiedenmann have taken a major step forward in heather care for golf courses and heritage sites with its new heather management system, the first in the UK. This enables cutting that is much kinder to the heather as well as making it much easier, cheaper and cleaner to harvest heather seed than before.

Instead of a flail mower which rips out heather plants, Wiedenmann's system uses its Super Pro TXL rotary mower specially adapted to cut grass at 200mm growing above the heather. Debris is sucked away to a Wiedenmann MCS collector. Once the seeds have ripened, the mower cuts off the heads and the seeds go into the collector. It takes only five minutes to lower the mower ready for normal cutting.

Already successfully installed and working efficiently at centres across the UK, it features the Super Pro TXL side deck discharge mower connected to either an MCS Favorit or MCS XP and a tractor.

The opportunities and performance options are many and depend on the size of tractor, the collector capacity and the height of the tip discharge. A connecting device kit which comprises a long hose and brackets attaches to the tractor via front linkage.

**Your local Wiedenmann dealer can advise you of the options.
